-1- FUNCTION: NEUROEXCITATORY PEPTIDE; INCREASES THE IMPULSE FREQUENCY
AND PRODUCES A SPIKE BROADENING OF THE IDENTIFIED HEART EXCITATORY
NEURON (PON); ALSO ENHANCES THE AMPLITUDE AND FREQUENCY OF THE
HEART BRAT. HAS ALSO AN EFFECT ON SEVERAL OTHER MUSCLES.
PIR; A32480; A32480.

"The expansion behaviour of sea anemones may be coordinated by two inhibitory neuropeptides, Antho-KAamide and Antho-Riamide.";
Proc. R. Soc. Lond., B. Biol. Sci. 253:183-188(1993).
-!- FUNCTION: Inhibits spontaneous contractions in several muscle groups. May be involved in the expansion phase of feeding behaviour in sea anemones.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Neuron-specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE-92195954; PubMed-1686933;

"The expansion behaviour of sea anemones may be coordinated by two inhibitory neuropeptides, Antho-KAamide and Antho-RIamide.";
Proc. R. Soc. Lond., B. Biol. Sci. 253:183-188(1993).
-!- FUNCTION: Inhibits spontaneous contractions in several muscle groups. May be involved in the expansion phase of feeding behaviour in sea anemones.
-!- SUBCELIULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Neuron-specific.
Neuropeptide; Amidation.
                                                                                                                                                                                                                            ;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A; Title: Primary structure and biological activity of bradykinin potentiating peptides !

A; Reference number: A37196, MUID:90351557; PMID:2386615

A; Reterence type: protein

A; Residues: preliminary

A; Molecule type: protein

A; Residues: 1-3 < CIN>

C; Keywords: pyroglutamic acid

E; I/Modified site: pyrrolidone carboxylic acid (Gln) #status experimental
                                                                                                                                                                                                                   RESULT 14

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                     8, 2003, 09:13:31; Search time 1.85859 Seconds (without alignments) 91.060 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 38, A

US-08-406-192-12

Sequence 12, Application US/08406192

Patent No. 5739287

GENERAL INFORMATION:

PAPLICANT: Wilbur, D. Scott

APPLICANT: Prathare, Pradip M

TITLE OF INVENTION: Biotinylated Cobalamins

NUMBER OF SEQUENCES: 47

CORRESPONDENCE ADDRESS:

ADDRESSEE: Christensen, O'Connor, Johnson and Kindness

STREET: 1420 Fifth Avenue, Suite 2800

CITY: Seattle

STRATE: Washington

COUNTRY: US.A.

ZIP: WA 98101-2333

COMPUTER: READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: BM PC Compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.30

CUASSIFICATION NUMBER: US/08/406,192

FILING DATE: 16-MAR-1995

CLASSIFICATION NUMBER: US 08/224,831

FILING DATE: 08-APR-1994

ATTORNEY/AGENT INFORMATION:

NAME: Reansoni, George E

REGISTRATION NUMBER: 37,919

REFERENCE/DOCKET NUMBER: RECL18947

TELECOMMUNICATION INFORMATION:

Sequence 2, Application US/09248158
Patent No. US20020015678A1
GENERAL INFORMATION
APPLICANT: Yuan, Zhengyu
APPLICANT: Chen, Zhong-Xiao
ITILE OF INVENTION: Direct Adsorption Scintillation Assay
TITLE OF INVENTION: For Measuring Enzyme Activity and Assaying Biochemical
ITILE OF INVENTION: Processes
FILE REFERENCE: 342312000600
CURRENT APPLICATION NUMBER: US/09/248,158
CURRENT FILING DATE: 1999-02-09
PRIOR FILING DATE: 1998-02-10

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                    A Geneseq 197un03:*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                         The present peptide represents a proteinase site used in the creation of the bone morphogenetic fusion proteins of the invention. The bone morphogenetic fusion protein may contain some or all of the following elements: a purification tag a proteinase site, an ECM/bone binding site, a second proteinase site, and a bone morphogenetic protein active fragment. The fusion proteins of the invention also includes proteins that have transforming growth factor beta active fragments instead of bone morphogenetic protein active fragments. The bone morphogenetic fusion proteins can be used for enhancing wound healing

The present sequence is a conantokin peptide derivative, which can be used to treat neurologic and psychiatric disorders, e.g. as an anticonvulsant, neuroprotective or analysesic agent. Neurologic and psychiatric disorders include epilepsy, convulsions, neurotoxic constructions of hypoxia, anoxia or ischaemia, microflation stroke, cerebrovascular accident, brain or spinal cord trauma, myocardial infarct, physical trauma, drowning, suffocation, perinatal asphyria or hypoglycaemic events), curvodegeneration (associated with Alzheimer's disease, semile dementia, Amyotrophic Lateral Sclerosis, Multiple Sclerosis, Paxkinson's disease, Huntington's disease, Down's Syndrome, carakoff's disease, schizophrenia, AlDS dementia, multi-infarct dementia, Binswanger dementia and neuronal damage associated with curcontrolled seizures), chemical toxicity (such as addiction, and morphine, opiate, opioid and barbiturate tolerance), pain (acute, offonio: migraine), anxiety, major depression, manic-depressive, cillness, obsessive-compulsive disorder, unipolar depression, dysthymia and seasonal effective disorder, unipolar depression, dysthymia and seasonal effective disorder, unipolar depression, dysthymia captide can also be used to treat HIV infection, ophthalmic peptide can also be used to treat HIV infection, ophthalmic indication and memory, learning or cognitive defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Conantokin; predatory cone snail; treatment; neurologic disorder; psychiatric disorder; anticonvulsant; neuroprotective; analgesic. be used to treat neurologic and psychiatric disorders, e.g. as anticonvulsant, neurologic and psychiatric disorders, e.g. as anticonvulsant, neuroprotective or analgesic agent. Neurologic and psychiatric disorders include epilepsy, convulsions, neurotoxic injury (associated with conditions of hypoxia, anoxia or ischaemia, which typically follow stroke, cerebrovascular accident, brain or spinal cord trauma, myocardial infarct, physical trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic events), centrodegeneration (associated with Alzheimer's disease, senile demential, Amyotrophic Lateral Sclerosis, Multipple Sclerosis, Parkinson's disease, Huntington's disease, Down's Syndrome, Corsakoff's disease, Schizophrenia, AIDS dementia, multi-infarct dementia, Binmanger dementia and neuronal damage associated with uncontrolled seizures), chemical toxicity (such as addiction, and morphine, opiate, opioid and barbiturate tolerance), pain (acute, offonic, migraine), anxiety, major depression, manic-depressive illness, obsessive-compulsive disorder, unipolar depression, dysthymia and seasonal effective disorder, unipolar depression, dysthymia and seasonal effective disorder, unipolar disorder, innipolar disorder), and seasonal effective disorder, unipolar disorder, innipolar disorder), and seasonal effective disorder, unipolar disorder), and seasonal effective disorder, and escapanic disorder and environment disorder), and environment disorder) and environment disorder).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Conantokin; cone snail; nerve cell excitation; NMDA receptor; epilepsy;

of cone snalls. They are used for the treatment of disorders in which excitation of marve calls by excitatory amino acids or agonist of N-methyl-D-aspartate (NMDA) receptor. The conancokin peptides are used for the treatment of disorders such as pain; neurologic or psychiatric disorders such as pain; neutrologic or psychiatric disorders such treatment of hypoxia, anoxia or ischemia; for treating neurodegeneration; for breating chemical toxicity such as addiction, drug craving, alcohol abuse, morphine, opioid and barbiturate tolerance; for treating psychiatric disorders such as anxiety, major depression, manic-depression illness, obsessive compulsive disorder, schizophrania or mood disorder; for treating odditional neurological disorders e.g. dystonia, sleep disorder; muscle relaxation and urinary incontinence; for memory/cognition enhancement; for treating HIV
                                                                                                                                                                                                          AAG79012-43 and AAG790054-56 represent domains of conantokin peptides. Conantokins differ from conotoxins, in that they contain gamma-carboxyglutamic acid. The conantokins are derived from the venom

                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                        ö
                                                                                                  The invention related to modified neurotoxins especially Clostridial botulinum toxins with altered biological persistence. These toxins comprise a structural modification which is effective to alter the biological persistence. Modified neurotoxins of the invention are used for treating biological disorders which include neuromuscular disorder e.g. strabismus, blepharospasm, spasmodic torticollis (cervical dystonia), oromandibular dystonia and spasmodic dysphonia (laryngaal dystonia), autonomic nervous system disorders e.g. excessive salivation and sweating, asthma etc. and pain e.g. headache, muscular tension, neuralgia and neuropathy. The present sequence is botulinum toxin services.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Soybean; diverged delta-9 fatty acid desaturase; enzyme; cellular lipid; oil; transgenic plant; gene mapping; immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to diverged delta-9 fatty acid desaturase proteins and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular lipids, including oil, in tissues when the enzyme is absent or rate-
                    Modified neurotoxin especially Clostridial toxins, useful for treating neuromuscular and autonomic nervous system disorder and pain, comprises structural modification to alter biological persistence of neurotoxin
                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New delta-9 fatty acid desaturase polypeptides and polynucleotides, useful in creating transgenic plants having altered levels of mono-, poly- and unsaturated fatty acids and in increasing the unsaturation levels in cellular lipids -

limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, thus altering the level of mnore, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RFLP) markers. The peptides and be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is soybean diverged delta-9 fatty acid desaturase peptide (residues

of proteolytic peptide fragments. The method comprises

Cragmenting at least a first protein sample and a second protein

Establishmenting at least a first protein sample and a second protein

ample to produce a first peptide pool and a second peptide pool;

least one of the pools so as to permit resolution of the peptides in at

least one of the pools so as to permit resolution of the cherwise

identical peptides in the first and second peptide pools by mass

analysis; contacting peptides from at least a portion of both of the

peptide pools with a capture moiety to yield affinity-selected peptides

comprising an affinity ligand, where the capture moiety selects for the

affinity ligand; and analysing the affinity-selected peptides by mass

spectrometry to determine one or more differences between the first and

second samples. The method of the invention is useful for identifying one

or more proteins in the sample, and is typically useful for identifying

multiple proteins in a single complex mixture. The method is also useful

cor quantifying proteins in a sample complex mixture. The advantages

of the novel method are that it is easier to separate peptides than

priving the analysis returners of the protein does not have to be maintained

proteins; native structure of the protein does not have to be maintained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      identification of a protein in a complex sample without purifying the protein or obtaining its composite peptide signature. The present sequence is C-terminal fragment of a differentially acetylated arginine-containing peptide which is used to generate fragment ions for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to an antibody specific for (-5,-6 and -7)-proPSA (prostate-specific antigen), but with no reactivity with (-4)
    employing mass spectrometric analysis

or shorter forms of the protein. The antibody can be used to diagnose prostatic carcinome and to detect human pro-kallikrein 2. The present sequence is a peptide which forms part of a peptide-containing immunogen described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to an antibody specific for (-5,-6 and -7)-proPSA (prostate-specific antigen), but with no reactivity with (-4) or shorter forms of the protein. The antibody can be used to diagnose prostatic carcinoma and to detect human pro-kallikrein 2. The present sequence is a peptide which forms part of a peptide-containing immunogen described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antibody comprising specificity for some truncated forms of pro-prostate specific antigen, useful in immunoassays for differential diagnosis of prostatic carcinoma
                                                                                                                                                                                                                                                                                                                                                                     PSA; prostate-specific antigen; prostatic carcinoma; pro-kallikrein 2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   19-SEP-2002
ABJ36806;
The invention relates to a novel method for identifying a G protein coupled receptor (GPCR) signaling inhibitor. The novel method comprises selecting or identifying a member of a library of peptides and/or candidate compounds, having binding to a GPCR of higher affinity than that of the native peptide. The peptide library is based on a native GPCR binding peptide. The method is useful for identifying inhibitors of a G protein coupled receptor (GPCR) signaling. The method is particularly useful for identifying drugs that antagonise the binding between a GPCR and its extracellular ligand(s). The method is especially useful in modern high throughput screening assays for identifying potent lead compounds. The compounds, peptides or inhibitors identified by the method are useful for preventing, andiorating or treating diseases in which GPCR signaling is a causative factor or in which a specific class of G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein is relevant, e.g. stroke, myocardial infarction, restenosis, atherosclerosis, hypotension, cancers, infections, septic shock, pain, allergic disorders, asthma, inflammatory bowel disease, osteoporosis, obesity, or psychotic and neurological disorders (e.g. anxiety, schizophrenia or Alzheimer's disease). This sequence represents a peptide relating to the G protein coupled receptors of the invention.
                                                                                                Nootropic; cardiant; antiarteriosclerotic; hypotensive; cytostatic; antibacterial; analgesic; antiallergic; antiasthmatic; antinflammatory; osteopethic; neuroprotective; anxiolytic; ancettic; lead compound; g protein coupled receptor signaling inhibitor; GPCR; library; high throughput screening assay; stroke; myocardial infarction; restenosis; atherosclerosis; hypotension; cancer; infection; asthma; septic shock; pain; allergic disorder; inflammatory bowel disease; obteoporosis; obesity; psychotic; neurological disorder; anxiety; schizophrenia; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying G protein coupled receptor (GPCR) signaling inhibitors, useful in screening drugs for treating stroke, cancers or pain, by identifying compounds that block GPCR mediated signaling with high affinity and specificity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       81.8%; Score 9; DB 24; Length 4; 66.7%; Pred. The invention relates to a novel method for identifying a G protein coupled receptor (GPCR) signaling inhibitor. The novel method comprises selecting or identifying a member of a library of peptides and/or candidate compounds, having binding to a GPCR of higher affinity than that of the native peptide. The peptide library is based on a native GPCR binding peptide. The method is useful for identifying inhibitors of a G protein coupled receptor (GPCR) signaling. The method is particularly useful for identifying daugs that antagonise the binding between a GPCR and its extracellular ligand(s). The method is especially useful in modern high throughput screening assays for identifying potent lead compounds. The compounds peptides or inhibitors identified by the method are useful for preventing, ameliorating or treating diseases in which are useful for preventing, ameliorating or treating diseases in which compounds a subjactive factor or in which a specific class of G protein is relevant, e.g. stroke, mycozadial infarction, restenosis, atherosclerosis, hypotension, cancers, infections, septic shock, pain, atherosclerosis, hypotension, cancers, infections, septic shock, pain, cobesity, or psychotic and neurological disorders (e.g. anxiety, cobesity, or psychotic and neurological disorders (e.g. anxiety, callaring to the G protein coupled receptors of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

```
Novel human transporter protein, related to gamma-aminobutyric acid neurotransmitter transporter subfamily useful as model for developing human therapeutic targets and serves as target for human therapeutics
                                                       Human; gamma-aminobutyric acid; GABA; neurotransmitter transporte
transgenic animal; ribozyme design; drug screening; gene therapy.
                                         Novel human transporter protein related peptide #4.
                                                                                                                                                                                      Di Francesco V, Beasley EM;

AAR03446;

GABA; neurotransmitter transporter;

Covalently linked complex for tumour treatment - comprises treating with protein, cytotoxic agent and enhancing moiety.

Claim 13; Page 22; 23pp; English.

```
in diagnostic assays for qualitative changes in gene expression, particularly in qualitative changes that lead to pathology; in gene therapy; and to detect mutations in genes encoding transporters. This is the amino acid sequence of a polypeptide related to the novel human aminobutyric acid (GABA) transporter related protein.
                                                                                                                                                                                                                                                                                                                                                                         (GABA) transporter related protein

When the anchoring peptide intercalates into the target cell plasma membrane the accessory moiety is translocated across the membrane and protrudes into the cytoplasm. It can then be phosphorylated by cellular kinases at neutral pH. This irreversibly anchors the complex to the membrane and may enhance the translocation into the cytoplasm. The complex is useful for treatment and diagnosis of tumours.
                                                                                                                                                                                                                                                                                                                              The sequence is one of several possible accessory moieties which can be

                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                           nEPOR is wild-type EPOR. CEPOR is a constitutive EPOR. It contains a point mutaion (a transition from C to T at nucleotide 484) which causes one substitution (Arg to Cys) in the exoplasmic domain of EPOR at codon 129 of the predicted N-terminus. The ARg to Cys point mutation in CEPOR is sufficient to induce factor-independent

"Purification and N-terminal sequencing of a 3 kDa antibacterial peptide from skin secretions of rainbow trout.";
Submitted (MAY-2002) to the SWISS-PROT data bank.
-!- FUNCTION: Has antibacterial activity against Gram-positive bacterium P.citreus.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Skin.

Biochem. Physiol. 95B:773-779(1990).

-I- FUNCTION: Lysozymes have primarily a bacteriolytic function; those in tissues and body fluids are associated with the monocytemacrophage system and enhance the activity of immunoagents.

-I- CATALYTIC ACTIVITY: Hydrolysis of the 1,4-beta-linkages between Nacetyl-D-glucosamine and N-acetylmuramic acid in peptidoglycan acetyl-D-glucosamine and N-acetylmuramic acid in peptidoglycan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -i- MISCELLANBOUS: Lysozyme C is capable of both hydrolysis and transglycosylation; it shows also a slight esterase activity. It acts rapidly on both peptide-substituted and unsubstituted peptidoglycan, and slowly on chitin oligosaccharides.
-i- SIMILARITY: Belongs to family 22 of glycosyl hydrolases. PIR; A60525; A60525.

-- FUNCTION: Hydrolyzes PPi generated in anabolic reactions.
-- CATALYTIC ACTIVITY: Diphosphate + H(2)0 = 2 phosphate.
-- COPACTOR: Requires the presence of divalent metal cation.
Magnesium confers the highest activity. Binds 4 divalent cations per submit (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
